

MSA Latchways Freestanding Constant Force Post®

Temporary by design

As a true Type E EN 795:2012 anchorage point, the MSA Latchways Freestanding Constant Force Post® is designed to rely solely on friction. It does not require any adhesives or other accessories that must be permanently fixed to the structure.

Built to last

With extremely robust components and hardware, wear and tear are not a problem. Still, any product placed on the market is, and will be, serviced thanks to the availability of spares and upgrade kits, making the product readily adaptable for different applications.

Easy to transport and set-up

Modular in design and with integral carry handles built-in, the MSA Latchways Freestanding Constant Force Post® breaks down into segments that can be easily moved from worksite to worksite. The set-up only requires 8 fixing bolts, making the assembly process extremely quick and easy.

No hidden costs

All parts supplied provide a fully functional MSA Latchways Freestanding Constant Force Post®. There is no need to purchase, transport or set up any additional materials separately, such as concrete slabs or water.

Highly usable

Only 1m in diameter, the design is truly compact, which is useful when space is limited, for example, if you have roof lights or equipment reducing the usable area.
